Assignment 3 - Due Apr 13, 2026 12:30 PM

- TECH1101:Web and Internet Fundamentals-26JANMNFS1

Create a cashier calculator website

Overview

In this assignment, you will develop a cashier calculator website using JavaScript. The page's appearance does not need to match the example provided below; however, it should still offer all the same functionality. In a real-life design, you might add more than one page, but for this exercise just one page is enough.

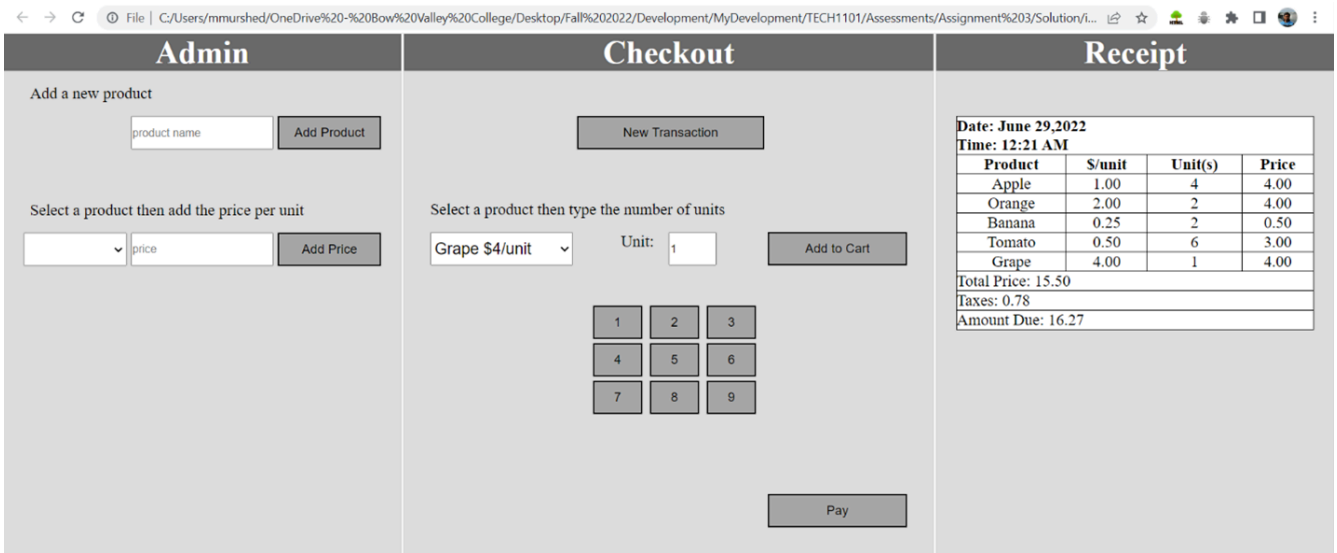

Figure: example cashier calculator website

Directions

- There is no starter code. Create your own layout and design using HTML and CSS.
- Your webpage does **not** need to be responsive and resize appropriately for all viewports. Assume the webpage will always be played on a laptop.
- There should be an "Admin" section which includes the following:
    - A method to add new products: a text box and a button.

    - A method to set a price for an existing product: a drop-down menu that lists all the existing products; a text box to enter a product's price per unit; a button to apply the price per unit to the selected product. You should use JavaScript array variables to save the products' data in memory.
- There should be a "Checkout" section which includes the following:
    - A button to start a new transaction ("New Transaction").
    - A drop-down menu that lists all the products, along with their per unit price. The cashier will use this to select which product is being purchased.
    - Nine buttons labeled 1 to 9. Clicking one of these buttons will specify the number of units of that product that are being purchased. A text input field ("Unit") will display the number that was clicked. Assume that the maximum number of units that can be purchased of any one product is 9.
    - A button to add the product to your cart ("Add to cart"), using the product that was selected and the number of units.
    - A button for the customer to pay for their products ("Pay"). Clicking this button will virtually receive the payment and display the receipt (see next section).
- There should be a "Receipt" section which includes the following:
    - A receipt should be displayed after a customer pays for their products (i.e. after clicking the "Pay" button).
    - Any previous receipt should be removed when "New Transaction" is clicked.
    - The contents of the receipt should include the following:
        - Current date and time.
        - A line item for each product purchased:
            - Product name
            - Price per unit
            - Number of units
            - Total price for each product
        - Calculate and display the sub-total amount
        - Apply a 5% tax
        - Display a grand total (with tax included).

- Your code should be properly indented.
- Your code should be properly commented.
- If you use any outside resources (websites, AI, etc.) make sure to properly reference them in your submission.

Submission instructions:

- Upload a zipped/compressed folder containing the necessary files.
- If you would like to receive feedback on this assignment, mention it in the Comments box.

Rubric:

- 100 points available.
- Partial credit will be given.
- This assessment will be graded for **functionality only**.

Grading Items	**Points**
Admin: users can add new products.	10
Admin: users can set the price per unit of existing products.	10
Checkout: users can start a new transaction that empties the shopping cart and retains all of the Admin information.	10
Checkout: users can add any number of units (1-9) of a product to their cart.	10
Checkout: users can pay for all of the products in their cart.	10
Receipt: a receipt is displayed after a customer pays, and removed when a new transaction is started.	10
Receipt: a receipt displays all of the required information.	10
Website offers all of the same functionalities as the example figure provided above.	10

Code contains no invalid statements or errors.	10
Coding best practices are followed. • Appropriate usage of comments that explain your logic and intention. • Use whitespace and indentation to make your code easy to read.	10

Assignment 3
